

A leading developer and operator of flexible power, grid stability and battery technologies – working closely with our partners, we provide clean, flexible, distributed power and innovative grid stability solutions to support the UK’s transition to a net zero sustainable energy system.

With 550MW of flexible generation under management and a series of grid stability projects in construction and development, we play an important role in supporting a UK electricity network which is increasingly reliant on zero carbon but intermittent renewable energy sources.

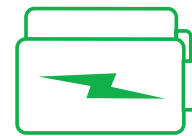

We provide a comprehensive asset management service to a range of customers, from project development, funding, construction, operation, financial management, electricity trading, optimisation of assets and much more, it is our depth of experience that ensures we deliver for all our stakeholders.

- Employee owned with a unique entrepreneurial track record in the UK energy sector.

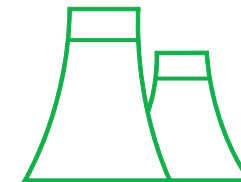

- Over 150 years accumulated power industry experience in senior management team.

- Welsh Power manages over 550MW of flexible generation for its customers.

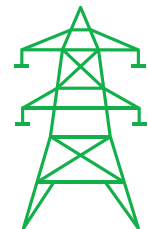

Our unrivalled experience within the energy sector:

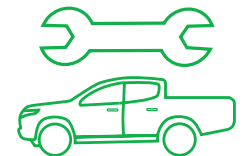

We develop and manage the construction of multiple grid stability and battery storage projects

We owned and operated large coal and gas-fired power plants

We have experience in creating and running an electricity supply business

We owned and managed a power engineering business

We have developed and managed portfolios of flexible embedded power generation plants; operating in both reserve services and merchant power markets
